

Optimise organisational efficiency and satisfaction with Adobe Acrobat Sign

Issued by [DaxData](#)

29 May 2023

Many organisations already using Adobe Acrobat Sign are experiencing faster sales cycles than with traditional methods alone. Adobe have incorporated further automations and integrations with the Acrobat Sign Workflow Designer.

In the past few years, many organisations have been turning their attention to identifying extra ways that they can increase organisational cost savings. In doing so, they have recognised that it is vital to conduct business digitally for the sake of business velocity and continuity. As organisations get accustomed to using digital workflows, they experience increased demands to innovate and streamline their businesses further.

Your organisation may already be using [Adobe Acrobat Sign](#) and seeing faster sales cycles, reduced per-transaction costs, and 30% faster transactions than with traditional methods. But there is more that Acrobat Sign can do to help organisations. With these factors in mind, they have made further enhancements to the Adobe Acrobat Sign Workflow Designer.

Acrobat Sign visual design tool

The Acrobat Sign Workflow Designer helps you easily automate every task in a document workflow from start to finish. It is a highly intuitive process anchored in a guided send experience that increases speed, reduces errors, and minimises work.

Importance of Workflow

“Workflow Designer provides users with a powerful way to improve Acrobat Sign usage and access across an organisation. And, because Acrobat Sign is easy to use and can be tailored to fit different departments and their needs, it is easy to bring others into the process, building trust and driving efficiencies,” says Dominic Richardson, CEO of local Adobe distributor, Dax Data.

It is easy to connect the dots among key organisational stakeholders considering Acrobat Sign. It integrates with so many leading business solutions you and your organisation may already be using (like Salesforce, Microsoft, and Workday). Once connected, use Workflow Designer to tackle advanced workflows with complex logic and rules, addressing your most

challenging needs.

Adobe Acrobat Sign is excited to announce new features that help streamline customer experiences and business workflows.

Acrobat Sign productivity enhancements:

Save web forms in progress

Many forms can be long and complex which may take longer than one session to complete. Web forms in [Adobe Acrobat Sign](#) are ideal for turning downloadable PDFs and paper forms into online interactive web forms you can fill and sign right on your webpage. With the new release, you can now save your progress in a web form. When you save, it will send you an email so you can pick up where you left off.

This is ideal when you have long and complex forms that you are not able to complete in one sitting. For example, if you are completing documents as part of an account opening, you can reduce abandoning rates by allowing them to start at one time and pick up where they left off from the email sent to them. This is also beneficial for use-cases like:

- Bank account and investment forms.
- Insurance forms.
- Student services forms in education.

Document automation

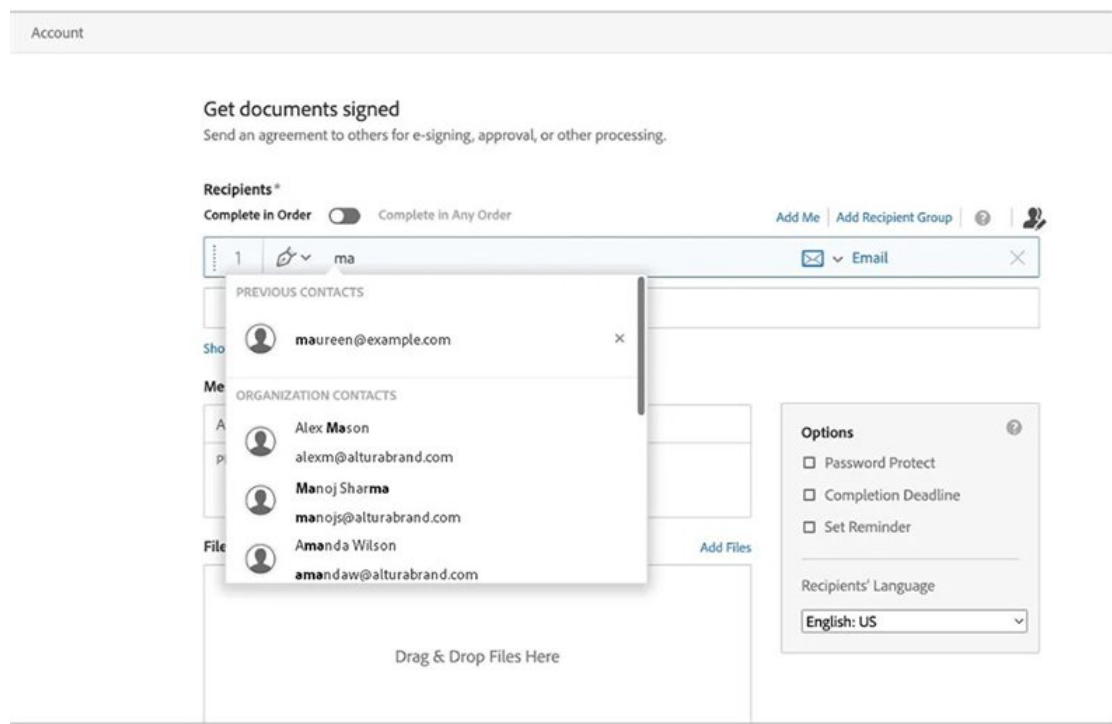

Document workflows are often repeatable business processes within an organisation. To help with this, Adobe is adding new features to help you create these standardised workflows to help streamline your business processes.

Streamline processes with the new workflow designer for any user

To help boost productivity, Acrobat Sign now allows you to enable any user (not just administrators) to create their own signing workflows for repeatable processes. The benefits include:

- The ability to customise your Send page.
- You can specify pre-defined named recipient roles as part of a specific workflow.
- You can pre-define routing for a specific business process.
- The ability to specify which notification emails are enabled as part of a particular workflow.
- You can specify documents that should be included as part of an agreement.
- You could rename fields to match the terminology of your business process or organisation.
- The sender can specify form inputs and pre-populate fields within a document for a faster and simpler signing process.

Create advanced workflows with embedded Microsoft Power Automate

Business processes can be complex. They can involve many different business systems for creation, approvals, and document storage. Document routing can vary based on business processes such as dollar value, department, role, and other characteristics. To help manage this, Adobe Acrobat Sign embeds [Microsoft Power Automate](#) to allow you to create complex workflows. The benefits include:

- The ability to route documents and agreements based on criteria such as contract value.
- The capability to generate more complex document workflows or the ability to create dynamic agreement templates with conditional sections using Adobe Acrobat Services.
- Integration with over 700+ turnkey premium connectors including Microsoft Teams, Slack, Salesforce, Microsoft Dynamics 365, Power Apps, and many others.
- The ability to store documents automatically in document repositories such as SharePoint, Google Drive, Dropbox, BOX, and many others.
- Pre-created flow templates to easily create common workflows such as storing documents after signature, sending documents from SharePoint and [others](#).
- The capacity to extract form data from documents to populate into data systems automatically like SAP, Microsoft Lists, Excel, Salesforce, and others.

Microsoft Power Automate in Acrobat Sign is provided free to all Acrobat Sign Enterprise customers. Power Automate in Acrobat Sign also includes access to Premium connectors to enterprise applications, which incorporates connectors like Salesforce, Oracle, Microsoft Dynamics 365, and others that can also be enabled for group level access to Power Automate.

Maximise Acrobat Sign for your business

As organisations are becoming digital first, they are looking for ways to streamline and automate business processes.
