The project will have a production capacity of up to 8 million tonnes of green hydrogen or other hydrogen-based end products annually, with an electrolyser capacity of up to 10 gigawatts, the company said in a joint statement with the firms involved and the Mauritanian government.

"(This project) will have a strong link to Germany both as a technology provider and a potential offtaker of green energy," Conjuncta chief executive Stefan Liebing said.

Compensating for Russian fuel imports

Germany has been scrambling to ramp up its renewables capacity to compensate for Russian fuel imports and meet climate targets. In December, Berlin approved the construction of the country's first hydrogen pipeline network.

The first phase of the Mauritania project, to be located northeast of the coastal capital of Nouakchott, should be completed in 2028 with planned capacity of 400MW, it said.

The German government and the economy ministry were not immediately available for comment on the agreement.
